WEDGE-ALL® Wedge Anchors

The Wedge-All is a non-bottom bearing, wedge style expansion anchor for use in solid concrete or grout filled masonry. A one-piece clip ensures uniform holding capacity that increases as tension is applied. The threaded stud version is available in nine diameters and multiple lengths. A single size tie-wire version is available for wire supported fixtures. Threaded studs are set by tightening the nut. Tie-wire anchors are set with the claw end of a hammer.

WEDGE-ALL SPECIAL FEATURES:

- One piece wrap around clip
- Threaded end is chamfered for ease of starting nut.
- Most sizes feature full thread for added versatility.

MATERIAL:

Carbon and stainless steel

FINISH:

Carbon steel anchors are available zinc plated or mechanically galvanized.

CODES:

(Stud anchor only) ICC-ES ESR-1396; City of L.A. RR24682; Dade County 01-0820.06; Factory Mutual 3017082; Florida FL 5415.3; Underwriters Laboratories File Ex3605; Meets requirements of Federal Specifications A-A-1923A, Type 4. The Load Tables list values based upon results from the most recent testing and may not reflect those in current code reports. Where code jurisdictions apply, consult the current reports for applicable load values.

TEST CRITERIA:

The Wedge-All anchor has been tested in accordance with ICC-ES's Acceptance Criteria for Expansion Anchors in Concrete and Masonry Elements (AC01). ICC-ES report ESR-1396 recognizes the carbon and stainless steel Wedge-All for the following:

- Static Tension and Shear Loading.
- Seismic and Wind Loading.
- Combination Tension and Shear Loading.
- Critical and Minimum Edge Distance.

INSTALLATION:

- Holes in metal fixtures to be mounted should exceed nominal anchor diameter by 1/8" for 1/4" thru 5/8" diameter anchors, and by 1/4" for all other diameters.
- Do not use an impact wrench to set or tighten the Wedge-All.

Caution:

Oversized holes in the base material will make it difficult to set the anchor and will reduce the anchor's load capacity.

Threaded studs:

- Drill a hole in the base material using a carbide drill bit the same diameter as the nominal diameter of the anchor to be installed. Drill the hole to the specified embedment depth and blow it clean using compressed air. Overhead installations need not be blown clean. Alternatively, drill the hole deep enough to accommodate embedment depth and dust from drilling.
- Assemble the anchor with nut and washer so the top of the nut is flush with the top of the anchor. Place the anchor in the fixture and drive into the hole until washer and nut are tight against fixture.
- Tighten to the required installation torque.

Tie-Wire:

- Drill a hole at least 1 1/2" deep using a 1/4" diameter carbide tipped bit.
- Drive the anchor into the hole until the head is seated against the base material.
- Set the anchor by prying/pulling the head with the claw end of the hammer.

SUGGESTED SPECIFICATIONS:

Wedge anchors shall be a threaded stud with an integral cone expander and a single piece expansion clip. The stud shall be carbon steel with a minimum 70,000 psi tensile strength, or type 303, 304 or 316 stainless steel, as called for on the drawings. Anchors shall meet Federal Specification A-A-1923A, Type 4. Anchors shall be Wedge-Alls from Simpson Strong-Tie, Pleasanton, CA. Anchors shall be installed following Simpson Strong-Tie's instructions for Wedge-Alls.

- The published length is the overall length of the anchor. Allow one anchor diameter for the nut and washer thickness plus the fixture thickness when selecting the minimum length.
- Special lengths are available on request. Load values are valid as long as minimum embedment depths are satisfied.
- Tie-Wire Wedge-All, overall length is 2".
- Tie-Wire Wedge-All also available in bulk quantity of 2,000, model TWD25112B.
- Bulk packaged Wedge-Alls available, call Simpson for details.

1. Anchors with the "SS" suffix in the model number are manufactured from type 303 stainless steel, the remaining anchors (with the "4SS" suffix) are manufactured from type 304 stainless steel. 303 stainless anchors may require extra lead time, call factory for details. Types 303 and 304 stainless steel perform equally well in certain corrosive environments.
2. Anchors with the "3SS" suffix in the model number may require extra lead time call factory for details.
3. These package quantities available in 303 stainless steel only.
4. The published length is the overall length of the anchor. Allow one anchor diameter for the nut and washer thickness plus the fixture thickness when selecting a length.

5. Special lengths are available on request. Load values are valid as long as minimum embedment depths are satisfied.
- Mini Pack:** These package quantities must be ordered with a "R" suffix on the end of the standard model number. (example: WA505124SS-R).

Material Specifications

304/303 Stainless Steel ¹			
Component Materials			
Anchor Body	Nut	Washer	Clip
Type 303 and 304 Stainless Steel	Type 18-8 Stainless Steel	Type 18-8 Stainless Steel	Type 304 or 316 Stainless Steel

1. Type 303 and 304 stainless steels perform equally well in certain corrosive environments. Larger sizes are manufactured from type 303.

Application: Exterior environment, high level of corrosion resistance. Resistant to organic chemicals, many inorganic chemicals, mild atmospheric pollution and mild marine environments (not in direct contact with salt water). See page 14 for more corrosion information.

Material Specifications

316 Stainless Steel ¹			
Component Materials			
Anchor Body	Nut	Washer	Clip
Type 316 Stainless Steel	Type 316 Stainless Steel	Type 316 Stainless Steel	Type 304 or 316 Stainless Steel

1. Type 316 Stainless Steel provides the greatest degree of corrosion resistance offered by Simpson.

Application: Exterior environment, high level of corrosion resistance. Resistant to chlorides, sulfuric acid compounds and direct contact with salt water. See page 14 for more corrosion information.

- The allowable loads listed are based on a safety factor of 4.0.
- Allowable loads may be increased by 33 1/3% for short-term loading due to wind or seismic forces where permitted by code.
- Refer to allowable load adjustment factors for edge distance and spacing on pages 126 & 128.
- Drill bit diameter used in base material corresponds to nominal anchor diameter.
- Allowable loads may be linearly interpolated between concrete strengths listed.
- Allowable loads for 1/4-inch size at 1 1/2-inch embedment apply to both the Wedge-All and Tie-Wire anchors. Installation torque does not apply to the Tie-Wire anchor.
- The minimum concrete thickness is 1 1/2 times the embedment depth.

Shear Loads for Carbon Steel Wedge-All (and Tie-Wire) Anchors in Normal-Weight Concrete

3/4 (19.1)	3 3/8 (86)	10 (254)	6 1/8 (156)	10,400 (46.3)	495 (2.2)	2,600 (11.6)	11,040 (49.1)	321 (1.4)	2,760 (12.3)	150 (203.4)

- The allowable loads listed are based on a safety factor of 4.0.
- For installations in concrete (not through metal deck), allowable loads may be increased by 33 1/3% for short-term loading due to wind or seismic forces.
- For installations through metal deck, allowable Tension loads must be decreased 23% and allowable Shear loads may be increased 33 1/3% for short-term loading due to wind or seismic forces.
- Refer to allowable load adjustment factors for edge distance on page 130.
- 100% of the allowable load is permitted at Critical Spacing. Loads at reduced spacing have not been determined.
- Drill bit diameter used in base material corresponds to nominal anchor diameter.
- The minimum concrete thickness is 1 1/2 times the embedment depth.
- Metal deck must be minimum 20 gauge.

Tension and Shear Loads for Carbon Steel Wedge-All Anchors in Grout Filled CMU

Size in. (mm)	Embed. Depth in. (mm)	Critical Edge Dist. in. (mm)	Critical End Dist. in. (mm)	Critical Spacing in. (mm)	8" Grout-Filled CMU Allowable Load Based on CMU Strength						Install. Torque ft-lbs (N-m)

Shaded Area = Placement for Full and Reduced Allowable Load Capacity in Grout-Filled CMU

- The tabulated allowable loads are based on a safety factor of 4.0 for installations under the UBC. For installations under the IBC and IRC, use a safety factor of 5.0 (multiply the tabulated allowable loads by 0.80).
- Listed loads may be applied to installations on the face of the CMU wall at least 1 1/4 inch away from headjoints.
- Values are for 8-inch-wide CMU Grade N, Type II, lightweight, medium-weight and normal-weight concrete masonry units conforming to UBC Standard 21-4 or ASTM C90. The masonry units must be fully grouted with grout complying with UBC Section 2103.4 or IBC Section 2103.12. Mortar must be Type M or S prepared in accordance with Section 2103.3 of the UBC and UBC Standard 21-15, or IBC Section 2103.8. The specified compressive strength of masonry, f'm, at 28 days must be a minimum of 1,500 psi.
- Embedment depth is measured from the outside face of the concrete masonry unit.
- Drill bit diameter used in base material corresponds to nominal anchor diameter.
- Allowable loads may be increased by 33 1/3 percent for short-term loading due to wind and seismic forces.
- Tension and Shear loads for the Wedge-All may be combined using the parabolic interaction equation (n=5/3).
- Refer to allowable load adjustment factors for edge distance on page 130.

**Load Adjustment Factors for Carbon Steel and Stainless Steel Wedge-All Anchors in Normal-Weight Concrete:
Edge Distance, Tension and Shear Loads**

How to use these charts:

1. The following tables are for reduced Edge Distance.
2. Locate the anchor size to be used for either a tension and/or shear load application.
3. Locate the edge distance (C_{act}) at which the anchor is to be installed.
4. The load adjustment factor (f_c) is the intersection of the row and column.
5. Multiply the allowable load by the applicable load adjustment factor.
6. Reduction factors for multiple edges are multiplied together.

Edge Distance Tension (f_c)

Edge Dist.	Size	1/4	3/8	1/2	5/8	3/4	7/8	1	1 1/4

12 1/2									1.00
15									

1. C_{act} = actual edge distance at which anchor is installed (inches).
2. C_{cr} = critical edge distance for 100% load (inches).
3. C_{min} = minimum edge distance for reduced load (inches).
4. f_c = adjustment factor for allowable load at actual edge distance.
5. $f_{c cr}$ = adjustment factor for allowable load at critical edge distance. $f_{c cr}$ is always = 1.00.
6. $f_{c min}$ = adjustment factor for allowable load at minimum edge distance.
7. $f_c = f_{c min} + [(1 - f_{c min}) (C_{act} - C_{min}) / (C_{cr} - C_{min})]$.

Load Adjustment Factors for Reduced Spacing:

Critical spacing is listed in the load tables. No adjustment in load is required when the anchors are spaced at critical spacing. No additional testing has been performed to determine the adjustment factors for spacing dimensions less than those listed in the load tables.

Load Adjustment Factors for Carbon Steel and Stainless Steel Wedge-All Anchors in Normal-Weight Concrete: Edge Distance and Shear Load Applied Parallel to Edge

How to use these charts:

- The following tables are for reduced Edge Distance.
- Locate the anchor size to be used for a shear load application.
- Locate the edge distance ($C_{act||}$) at which the anchor is to be installed.
- The load adjustment factor ($f_{c||}$) is the intersection of the row and column.
- Multiply the allowable load by the applicable load adjustment factor.
- Reduction factors for multiple edges are multiplied together.

Edge Distance Shear ($f_{c||}$) (Shear Applied Parallel to Edge with End Distance $\geq ED_{min}$)

Edge Dist. $C_{act }$ (in)	Size	1/4	3/8	1/2	5/8	3/4	7/8	1	1 1/4

12									0.97
13									1.00

*See page 7 for an explanation of the load table icons

- Table is not applicable to anchors with $ED < ED_{min}$. Factors from this table may not be combined with load adjustment factors for shear loads applied perpendicular to edge.
- $C_{act||}$ = actual edge distance (measured perpendicular to direction of shear load) at which anchor is installed (Inches).
- $C_{cr||}$ = critical edge distance (measured perpendicular to direction of shear load) for 100% load (Inches).
- $C_{min||}$ = minimum edge distance (measured perpendicular to direction of shear load) for reduced load (Inches).
- ED = actual end distance (measured parallel to direction of shear load) at which anchor is installed (Inches).
- ED_{min} = minimum edge distance (measured parallel to direction of shear load).
- $f_{c||}$ = adjustment factor for allowable load at actual edge distance.
- $f_{c_{cr||}}$ = adjustment factor for allowable load at critical edge distance. $f_{c_{cr||}}$ is always = 1.00.
- $f_{c_{min||}}$ = adjustment factor for allowable load at minimum edge distance.
- $f_{c||} = f_{c_{min||}} + [(1 - f_{c_{min||}}) (C_{act||} - C_{min||}) / (C_{cr||} - C_{min||})]$.

WEDGE-ALL® Technical Information

**Load Adjustment Factors for Carbon Steel and Stainless Steel Wedge-All Anchors in Normal-Weight Concrete:
Spacing, Tension Loads**

How to use these charts:

1. The following tables are for reduced Spacing.
2. Locate the anchor size to be used for a tension load application.
3. Locate the anchor embedment (E) used for a tension load application.
4. Locate the spacing (S_{act}) at which the anchor is to be installed.
5. The load adjustment factor (f_s) is the intersection of the row and column.
6. Multiply the allowable load by the applicable load adjustment factor.
7. Reduction factors for multiple spacings are multiplied together.

- E = Embedment depth (Inches).
- S_{act} = actual spacing distance at which anchors are installed (Inches).
- S_{cr} = critical spacing distance for 100% load (Inches).
- S_{min} = minimum spacing distance for reduced load (Inches).
- f_s = adjustment factor for allowable load at actual spacing distance.
- f_{scr} = adjustment factor for allowable load at critical spacing distance.
 f_{scr} is always = 1.00.
- f_{smin} = adjustment factor for allowable load at minimum spacing distance.
- $f_s = f_{smin} + [(1 - f_{smin}) (S_{act} - S_{min}) / (S_{cr} - S_{min})]$.

**Load Adjustment Factors for Carbon Steel Wedge-All Anchors in Normal-Weight Concrete:
Edge Distance, Tension and Shear Loads**

How to use these charts:

1. The following tables are for reduced Edge Distance.
2. Locate the anchor size to be used for either a tension and/or shear load application.
3. Locate the edge distance (C_{act}) at which the anchor is to be installed.
4. The load adjustment factor (f_c) is the intersection of the row and column.
5. Multiply the allowable load by the applicable load adjustment factor.
6. Reduction factors for multiple edges are multiplied together.

Edge Distance Tension (f_c)   

Edge Dist. C_{act} (in)	Size	1/4	1/2	5/8	3/4
	C_{cr}	3 3/8	6 3/4	8 3/8	10
	C_{min}	1 3/8	2 3/4	3 3/8	4
	f_{cmin}	0.70	0.70	0.70	0.70
1 3/8		0.70			
1 1/2		0.72			
2		0.79

13				0.70	0.70
14				0.75	0.75
15				0.79	0.79
16				0.83	0.83
17				0.87	0.87
18				0.92	0.92
19				0.96	0.96
20				1.00	1.00

1. C_{act} = actual edge distance at which anchor is installed (Inches).
2. C_{cr} = critical edge distance for 100% load (Inches).
3. C_{min} = minimum edge distance for reduced load (Inches).
4. f_c = adjustment factor for allowable load at actual edge distance.
5. f_{cCR} = adjustment factor for allowable load at critical edge distance. f_{cCR} is always = 1.00.
6. f_{cmin} = adjustment factor for allowable load at minimum edge distance.
7. $f_c = f_{cmin} + [(1 - f_{cmin}) (C_{act} - C_{min}) / (C_{cr} - C_{min})]$.

Load Adjustment Factors for Reduced Spacing:
Critical spacing is listed in the load tables. No adjustment in load is required when the anchors are spaced at critical spacing. No additional testing has been performed to determine the adjustment factors for spacing dimensions less than those listed in the load tables.
